Abstract

Individuals' well-being can be evaluated by either the subjective or objective dimension. Studies that concentrated on the subjective dimension indicated that an individual's cognitive perception or satisfaction with different life domains deserves extensive exploration because such a perception reveals one's subjective evaluation of life experience. This project aims to understand subjective well-being of Taiwan population by collecting survey data on individuals' attitudes toward happiness, social connections, civil engagement, and governance. The associations of happiness with these important factors will be examined. Besides the telephone survey method adopted in the last year's project, we use web survey to collect data due to the concern that some cell phone and mobile device users may not be contacted by landline phones. The targeted subjects of the telephone and web surveys are the population of Taiwan aged 15 years or older. The sample of the telephone survey was drawn by random sampling, while the participants of the web survey were recruited online. Similar to the survey of previous year, this year's questionnaire contains items on social connections, civil engagement, governance, etc. Questions on happiness are retrieved from the core questions and domain evaluation questions of the "Guidelines on Measuring Subjective Well-being" published by the OECD. These questions are used to measure cognitive perception and satisfaction with life in general and with different life aspects. The constructed measures can be compared with those of the other countries in order to make cross-country analysis.
